

## **Aart Kroon**

Aart Kroon's main interest is in coastal morphodynamics, where he studies the interrelations between coastal processes, sediment transport rates and morphologic changes. Most of his work is based on the interpretation of field observations, quite often with the use of video remote sensing images techniques, and he has recently worked in Jutland on beaches near Vejers and the outer delta of the Knudedyb, and in coastal environments and fjords of North-East Greenland. At the University of Copenhagen, he also teaches and supervises master students in Integrated Coastal Zone Management, where the relations between the natural system and the socio-economic system play a major role.
